

CanSat: The best way to start getting involved in space

**Open Source Cubesat Workshop 2018
Daniel Sors Raurell**

CanSat & CubeSat origins

- Both concepts appeared hand to hand around 20 years ago
- Both with similar purposes: stimulate and simplify access to space
- CubeSat transition into commercial while CanSat remains educational
- <https://en.wikipedia.org/wiki/CubeSat>

International CanSat Competition

European CanSat Competition

www.cansat.eu

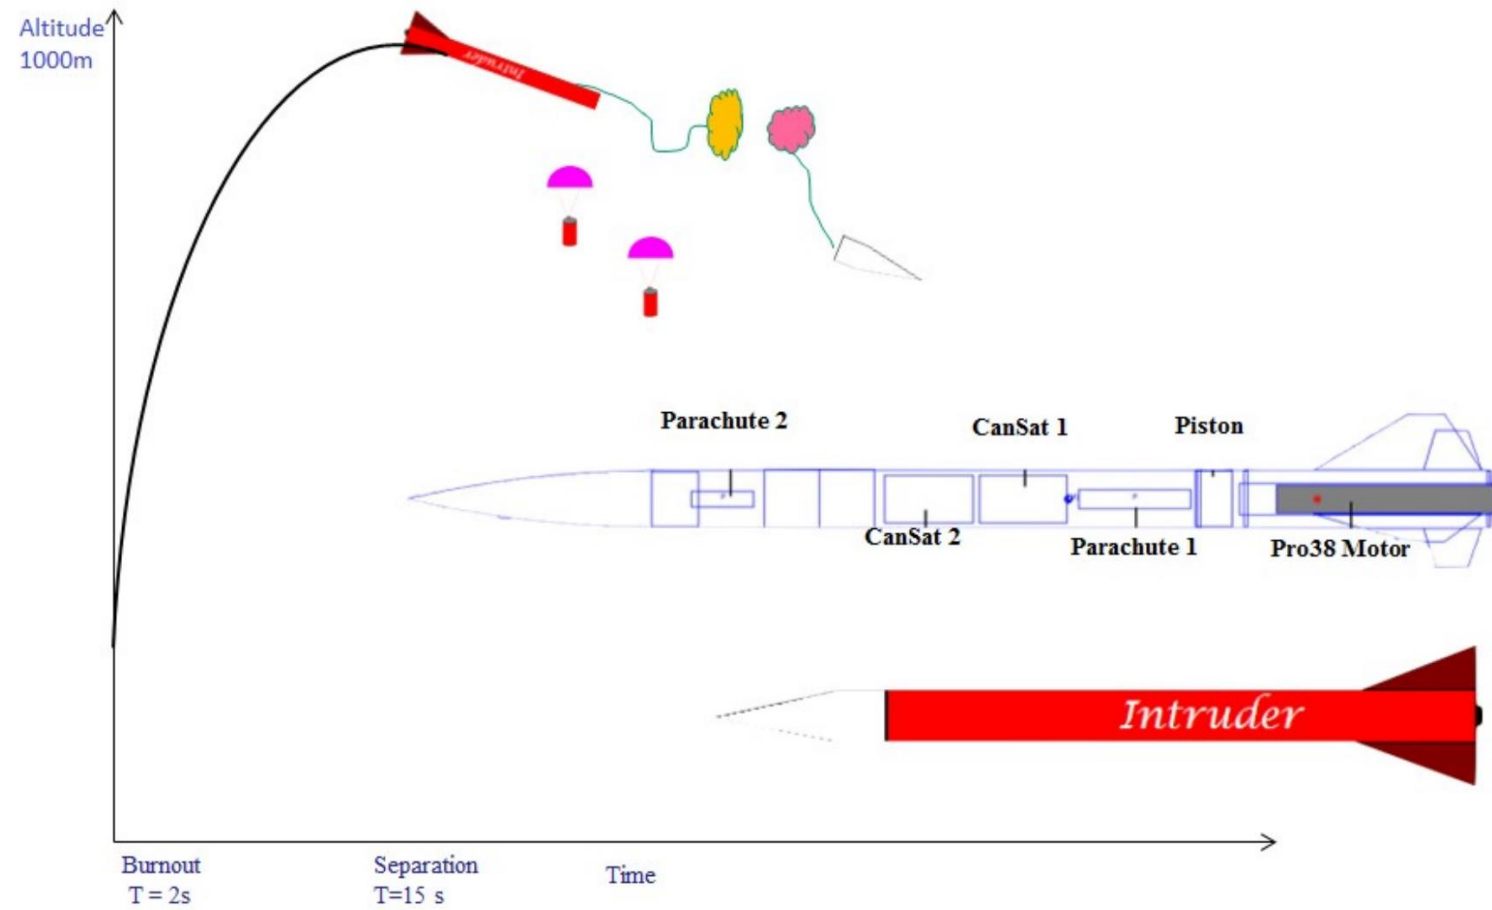

Cansat

Suborbital satellite in a can

- Primary mission:
Transmit air temperature and air pressure data at least every second to ground station.
- Secondary mission up to the team:
 - Transmit or gather other sensors information (acc, gyro, GPS, CO2...)
 - Autonomous flight
 - Test lander technologies
 - Ground sampling

The Rocket Launch

DESIGN

Modular

Open Source off the shelf components

Multiuse CanSat/GS/other

Technical features

- 5V and 3.3V additional outputs
- Yaggi antenna adapter
- Maximising payload volume
- Multiple communication channels

	Component	Quantity
electronic	Arduino Pro Micro	2
	Transceiver RFM69HW 433MHz	2
	Temperature and pressure sensor BMP180	2
	PCB board	2
	Voltage regulator	2
	Logic Level Converter (LLC)	2
	Battery connector	2
	Antenna	2
	Yaggy antenna adapter	1
	USB cable	1
structure	Shields	4
	M2 rods & M3 rods (threaded)	2 & 4
	Nuts, washes, hook	Loads

STRUCTURAL TECHNICAL SPECIFICATIONS

- 3D printed Shell (PLA)
- Two rod configuration
 - 3 rod mode
 - 1 rod mode

Specification	Value
Total mass	180g
Total volume	115h 66Φ mm (cil)

ELECTRONIC TECHNICAL SPECIFICATION

- Powered with a standard 9V battery
- Micro USB data connector
- 3 possible configurations
 - Modular
 - Integrated
 - Single PCB

Specification	Value
Electronic's mass	16g
Electronic's volume	40x30x20 mm

Arduino Micro pro

- ATmega32U4 running at 5V/16MHz.
- **Easy to program** using the Arduino Integrated development environment.
- On-Board micro-USB connector for programming.
- **I2C, SPI and UART serial communication** ports.
- 4 channels to read analogue signals using a 10-bit analogue to digital converter.
- 5 Pulse Width Modulated output pins.
- 12 Digital Input Output pins.
- Tiny footprint: 33.0 x 17.8 mm

INTEGRATION PROCESS

Single PCB version

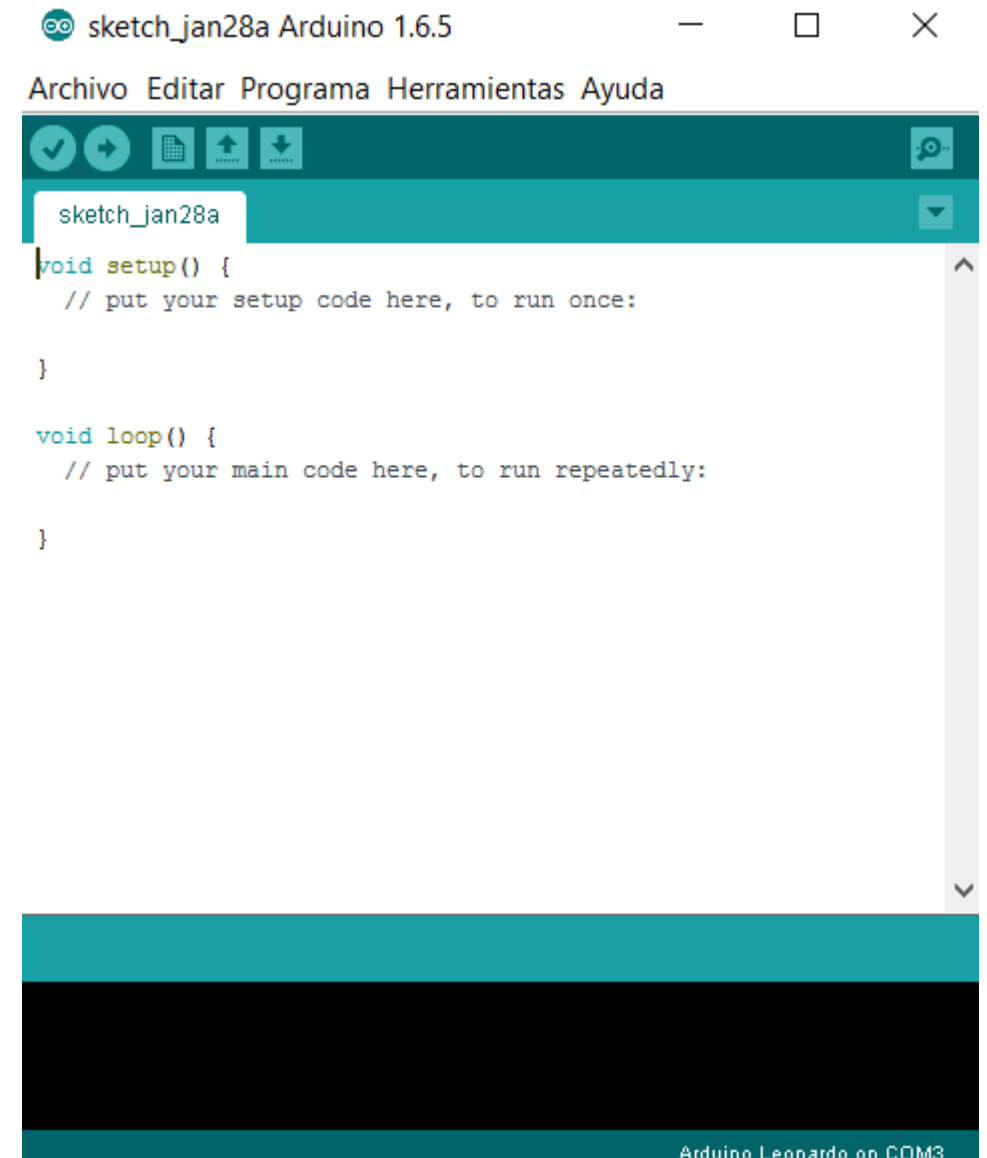

Increase in capability compared to the modular version

- 14x digital I/O
- 4x PWMs
- 6x analog I/O
- 2x 5V from voltage covnerter
- 1x 3V3 from voltage converter
- Raw battery voltage
- I2C, SPI and UART serial communication ports

SOFTWARE

- qbcn library provided: Contains basic functions to communicate and use the pressure and temperature sensor.
- qbcn and groundstation code examples provided.
- Arduino: Big community, tons of examples, libraries, tutorials and help online.
- Easy to code and test.

Cansat releasers

qbcan modular

This document is the **qbcan modular user manual**. It describes the qbcan CanSat kit, the soldering and assembly process and the software setup. It provides a step-by-step guide to help the user go through the development process, from the opening of the qbcan kit to transmitting data from one qbcan to another.

The qbcan kit has been developed by Open Cosmos. Open Cosmos is a start-up willing to use nano-satellites to provide simple and affordable access to space to organisations ranging from SMEs and research institutions to space agencies in developing countries.

qbcan compact

This document is the **qbcanc compact user manual**. It describes the qbcanc compact CanSat kit and the software setup. It provides a step-by-step guide to help the user go through the development process, from the opening of the qbcanc kit to transmitting data from one qbcanc to another.

The qbcan kit has been developed by Open Cosmos for the users that want to have a working solution out of the box avoiding the assembly of the parts and soldering and hence focus the efforts on the payload.

Support

In case you have any problem during the assembly or operations please post your questions into the [Open Cosmos community](#) so all the users can benefit from the content.
