Classification

| COMMS | Power | Classification |
|--------------|--------------|-----------------------|
| OK | OK | Satellite |
| Fail | OK | Debris |
| OK | Fail | Debris |
| Fail | Fail | Debris |

How long?

- Design and build COMMS subsystem
- Design and build ground station
- Send "Hello World"

What if...

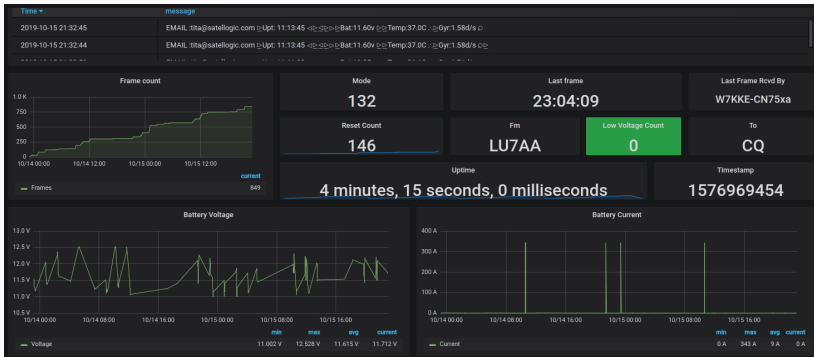

Add SatNOGS station...

Apply power...

Get Telemetry

The Project

- An ESA GSTP project
- 14 months duration
- Co-founded by Libre Space Foundation

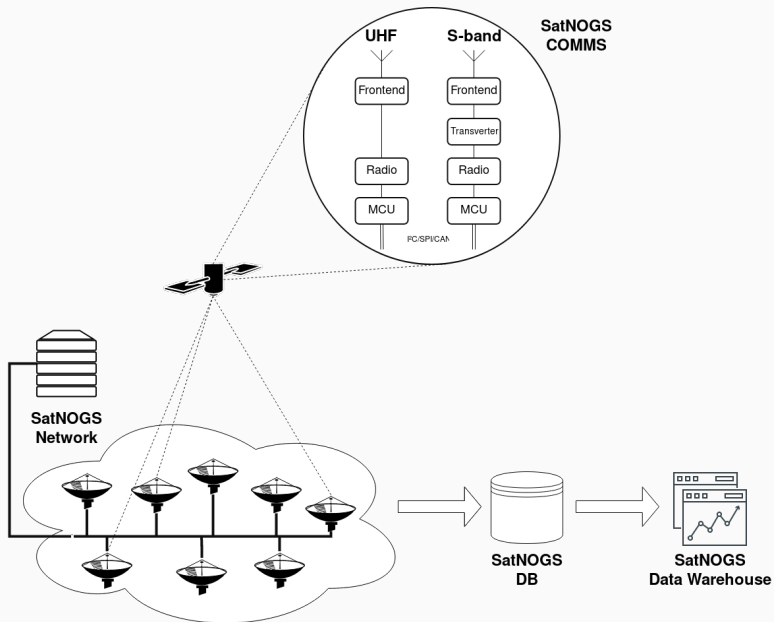

The goal!

Provide an open-hardware open-software TRL-6/7 10 × 10 cm communications board suitable for cubesats, with seamless SatNOGS network integration

- Two RF interfaces with downlink/uplink capabilities
 - UHF
 - S-Band
- Separate power management
 - Enable/Disable subsystems on demand
 - Over current protection
 - Logging
- MCU for controlling peripherals and basic stuff
- FPGA for demanding applications

- Telemetry format template
- Dashboard
- TX Capability

Overview

- UHF
 - TX Power: 1 W
 - Modulations: GFSK, GMSK, BPSK, QPSK
 - TX data rate: 2400 - 19200 kbit/s
 - RX data rate: 1200 - 9600 kbit/s

- S-Band
 - TX Power: TBA
 - Modulations: CCSDS BPSK, QPSK, IEEE 802.15.4
 - TX/RX data rates: Up to 900 kbit/s

- TX/RX SDR capabilities in the S-Band
- 13-bit LVDS interface with the FPGA
- Reference code for CCSDS TX/RX in SDR mode
- Reference code for spectrum analysis, cognition

- With one you get two!
- 1900 € for a flight model plus a free engineering model!

Thank you
